PORTFOLIO [portfolio-engger.vercel.app](#)

BORN 12/03/2000

EMAIL duclapulga@gmail.com

ADDRESS Nghĩa Đô, Cầu Giấy, Hà Nội

My name is Đức. I graduated from Electric Power University, majoring in Software Technology.

I have **5 years** as a Frontend Developer, most of it on visual editors and data-heavy dashboards. At LadiPage I maintain the drag-and-drop canvas engine customers build their pages in, and I work on the Next.js rebuild of the dashboard around it. Before that I spent nearly three years in e-learning: an e-textbook platform, a canvas authoring tool, and four products where I was the only frontend developer.

I am strong at **TypeScript, JavaScript and React**, and experienced with Next.js, canvas and drag-and-drop systems, HTML5, CSS3 and REST integration. I am also used to owning a codebase by myself and keeping it stable in production.

My goal is to become a **Full-Stack Developer**. I want to own more of the architecture and technical decisions, and to support the people I work with. I already write the server side of my own features, and I want to go further on that side.

EDUCATION

2018 — 2023

Electric Power University

B.Eng, Information Technology (Software Technology) · GPA 3.3 / 4.0

WORK EXPERIENCE

07/2024 — Now

Senior Frontend Developer

LadiPage

DOMAIN No-code landing page & e-commerce platform

LadiPage has two sides: the **builder** customers author their pages in, and the **dashboard** they run their business from. I maintain the builder engine on my own and contribute to the ground-up rebuild of the dashboard.

TEAM SIZE 3 frontend, 3 backend, 1 DevOps, 2 QA, 1 design, 1 PM (total 11)

Builder engine (sole ownership)

- I was onboarded onto the engine by the developer who owned it. They left about a year ago, and I've run it alone since. New element types, features and production bugs all come to me.
- Element types are plugins with their own property schema, so I can add one without touching the canvas core. New fields have to stay optional; otherwise pages built on older versions stop loading.
- Undo/redo works on diffs, not full-state snapshots. Every field I add has to take part in the diff or history breaks.
- I extend and support the form and checkout stack (validated fields, address pickers, cart, quantity, coupons, order bumps) across nine payment providers. Each one has its own redirect and callback quirks.
- Built the tracking and ads side of the product: **Facebook, TikTok, Zalo and Google pixels**, Google Ads conversion tracking, GTM and Google Analytics, and the **OpenAI Pixel** that measures visitors arriving from ChatGPT ads. Every field takes several IDs at once, and conversions also go server-side through **Conversion API** and TikTok postback, since the browser pixel alone drops events.

Dashboard rebuild

- The old dashboard put everything through Redux, including state nothing else read. The rebuild drops it: server state stays in the data layer, only state that really does span routes goes into context, the rest stays local to its feature.

- Built the typed API client for six separate backend products. Each wants a different set of identity headers and rejects the extras at CORS preflight, and each has its own store id. Send the wrong id and you get an empty list, not an error, so the mistake looks like missing data.
- Lists were filtering client-side over one fetched page, so anything past page one was wrong. I wrote the data-table contract every list screen now follows: server-side pagination, debounced search, sorting, filters, state synced to the URL, abortable requests.
- CRM pipeline totals come from server-computed summaries, not from summing the page in the browser. Card moves apply straight away and roll back if the write fails.

Cross-functional collaboration

- I work day to day with the product owner, QA, backend engineers and designers. Most of the back-and-forth is with backend: we agree the payload shape before either side starts, then I chase down the mismatches when the two do not line up.
- Work with backend teams to design and integrate APIs, troubleshoot integration issues, and ensure seamless end-to-end functionality.
- I guide **one fresher** on the builder — explaining how the engine fits together, reviewing what they write, and taking the parts that would break production.

Engineering practice

- Built the shared frontend contracts other screens are written against, and wrote the repository's engineering conventions.

PROJECT LadiPage Builder · LadiPage Dashboard

ROLE Senior Frontend Developer. Sole maintainer of the builder engine, core contributor on the dashboard rebuild

PROCESS Agile Scrum, run on the company's own project-management product

FRONTEND Next.js 16 (App Router, route handlers, edge middleware) · React 19 · TypeScript (strict) · JavaScript ES6 · AngularJS · jQuery

UI Tailwind CSS v4 · Radix UI · @dnd-kit · Tiptap · CodeMirror · Recharts · Canvas & DOM geometry

PLATFORM OAuth2 / SSO / JWT · Paddle billing · Facebook, TikTok, Zalo & Google pixels · **OpenAI Pixel (ChatGPT ads)** · Conversion API · GTM · Google Analytics · next-intl · Socket.IO · Firebase

TOOLS CI/CD · Git · Jira · Figma

09/2021 — 06/2024

Junior → Middle Frontend Developer

Early Start

DOMAIN EdTech — e-learning, e-textbook, CRM

EdTech group behind Monkey. My main project was **hoc10.vn**, a digital textbook platform for Vietnamese schools; I also shipped four smaller products as the only frontend developer.

hoc10.vn — national e-textbook platform 09/2021 — 04/2023

- Built the e-textbook library and question bank. Scoped the exam and homework flows for students, and the training and lecture tools for teachers: two different user roles in one product.
- Built, updated and maintained **BookTools**, a canvas authoring tool for interactive textbook activities. My first production drag-and-drop editor, and the reason I do builder work now.
- Owned performance and technical SEO for the public library. **Lighthouse performance went from 50–55 to 75–80** (FCP 0.5–1s, LCP 2.0s, CLS 0.00–0.08, Speed Index 3.0s).

Four further products 04/2023 — 06/2024

- **Sole frontend developer** on monkey.edu.vn, Monkey Class, AI M-Speaking and a tutoring CRM, each with one backend engineer. The whole frontend was mine.

- Virtual-classroom core (class, student and teacher management, homework, attendance), browser audio recording for AI pronunciation scoring, an internal CRM with a parent-facing progress portal, and Core Web Vitals plus multilingual work on the corporate site.

PROJECT hoc10.vn · BookTools · monkey.edu.vn · Monkey Class · AI M-Speaking · Tutoring CRM

TEAM SIZE hoc10.vn: 4 frontend, 2 backend · other products: 1 frontend (me) + 1 backend each

ROLE Fresher to Middle Frontend Developer. Feature analysis and scoping, refactoring and bug fixing

PROCESS Agile Scrum, tracked in Jira

FRONTEND React · Next.js 13 · JavaScript · Angular · PHP (Blade)

UI Fabric.js · Styled-components · Bootstrap

STATE & FORMS Redux · Zustand · React Hook Form + Yup · React Router

OTHER Web Audio / MediaRecorder · Google Analytics · Clevertap · CI/CD
